

# NOISE, VIBRATION & AIR QUALITY

The impacts of the built environment on human health have never been in sharper focus. Growing populations and the ever increasing need for new housing and infrastructure development are bringing more and more people into contact with health risks at home, at work and whilst travelling.

The need to understand and manage the risks to our long term well being are essential and our obligation to understand these health risks and develop new infrastructure in a way that eliminates or manages them sensitively is a fundamental prerogative for our generation.

Our environmental management team has experience in dealing with these human health issues on a wide range of developments, large and small.

## OUR CAPABILITIES INCLUDE:

- Liaison with local planning departments and the regulatory body
- Noise monitoring and reporting
- Dust monitoring and reporting
- Gas monitoring (including landfill gas) and reporting
- Fugitive emissions assessment and reporting
- Air quality management plans

Whether your noise or air quality challenge arises from transportation, an industrial or commercial operation or from the waste management sector, our team can help.
